Invest in "thin client," a virtual desktop that would live on a server and save money and resources and be more secure.

CURRENT CHALLENGE:

Currently we are spending a lot of money on refreshing computers. This also means we are using a lot of resources to refresh these computers like techs.

PROPOSED SOLUTION:

Instead of purchasing new computers every 4 years, we can invest into thin client. These thin client would basically have a virtual desktop. The virtual desktop would live on a server. This way we would save money and resources. Also thin clients can be more secure because there is no data being saved on the thin client.

BENEFITS TO FRESNO STATE:

This solution would save money and resources for Fresno State. Therefore, we can use the money and resources to focus on other issues that occur or on research and development.
